## Problem 2

A 2500 pound car is traveling 40 feet per second. The car's tires have a coefficient of friction with the road of .9.

- If the car is maintaining a constant speed, what is the minimum radius of curvature before slipping?
- Assuming the car is speeding up at a rate of 10 ft/s<sup>2</sup>, what is the minimum radius of curvature before slipping?

$$\Sigma F_z = F_g - F_N = 0$$
  
 $F_g = F_V = 2500 \text{ lbs}$ 

$$\Sigma F_{N} = F_{F} = M \alpha_{N}$$

$$\left(.9\right)\left(2500\,l_{05}\right) = \left(\frac{2500}{32.2}\right)\left(\frac{40\,f_{1/s}}{e}\right)$$

$$\hat{\nabla}_{c}$$

$$\sum_{k=1}^{\infty} \hat{\nabla}_{k}$$

$$\sum_{k=1}^{\infty} F_{F} \sum_{k=1}^{\infty} \Theta = M \quad G_{F}$$

$$\sum_{k=1}^{\infty} F_{F} \sum_{k=1}^{\infty} \Theta = M \quad G_{F}$$

$$\sum_{k=1}^{\infty} F_{F} \sum_{k=1}^{\infty} \Theta = M \quad G_{F}$$

$$\Sigma F_N = F_F \cos \theta = M \propto N$$

$$\Sigma F_c = F_F = Mac$$

$$(.9)(2500) = \left(\frac{2500}{32.2}\right)\sqrt{\alpha_t^2 + \alpha_N^2}$$

$$\left(\begin{array}{c}9\end{array}\right) = \frac{1}{32.2} \sqrt{10^2 + \left(\frac{40^2}{6}\right)^2}$$

$$(28.98)^{7} = 100 + \frac{2.56 \times 10^{6}}{e^{7}}$$
